# What is Rust?

Rust is a multi-paradigm, general-purpose programming language that aims to provide developers with a safe and efficient way to write low-level code.

# What is Rust?

Rust is a multi-paradigm, general-purpose programming language that aims to provide developers with a safe and efficient way to write low-level code.

- Memory-safe
- Compiled to machine code, no runtime needed
- High-level simplicity
- Low-level performance (on the same level as C or C++)

# Brief timeline of Rust

- 2007** Started as a side project by Graydon Hoare, a programmer at Mozilla
- 2009** Mozilla officially started sponsoring the project
- 2015** First stable version 1.0
- 2016** Mozilla releases Servo, a browser engine built with Rust
- 2019** `async/await` support stabilized
- 2021** The Rust Foundation is founded by AWS, Huawei, Google, Microsoft, and Mozilla
- 2021** The Android Open Source Project encourages the use of Rust for the SO components below the ART
- 2022** The Linux kernel adds support for Rust alongside C
- 2023** 8 years in a row the most loved programming language in the Stack Overflow Developer Survey

# Memory safety

It achieves memory safety without using a garbage collector or reference counting. Instead, it uses the concept of **ownership** and **borrowing**.

# Memory safety

It achieves memory safety without using a garbage collector or reference counting. Instead, it uses the concept of **ownership** and **borrowing**.

It prevents a wide variety of error classes at compile-time:

- Double free
- Use after free
- Dangling pointers
- Data races
- Passing non-thread-safe variables

If a violation of the compiler rules is found, the program will simply not compile.

# Immutability by default

---

```
fn main() {
    let x = 1;
    x = x + 1;
}
```

---

```
error[E0384]: cannot assign twice to immutable variable `x`
```

```
--> src/main.rs:3:5
```

```

|
2 |     let x = 1;
|       -
|       |
|       first assignment to `x`
|       help: consider making this binding mutable: `mut x`
3 |     x = x + 1;
|     ^^^^^^^^^ cannot assign twice to immutable variable

```

# Move semantics by default

Each value has only one owner. If a variable is passed to another function or scope, the owner of the value changes.

---

```
fn main() {  
    let name = String::from("Alice");  
    print_name(name);  
    println!("The name is: {}", name); // Compilation error  
}  
  
fn print_name(name: String) {  
    println!("Name: {}", name);  
}
```

# Algebraic Data Types, aka enums with fields

```
enum Shape {
    Circle { radius: f64 },
    Rectangle { width: f64, height: f64 },
    Triangle { base: f64, height: f64 },
}

fn main() {
    let shapes = vec![
        Shape::Circle { radius: 5.0 },
        Shape::Rectangle { width: 10.0, height: 8.0 },
        Shape::Triangle { base: 7.0, height: 4.0 },
    ];

    for shape in shapes {
        match shape {
            Shape::Circle { radius } => {
                let circle = Circle { radius };
                // Do something with the circle...
            },
            Shape::Rectangle { width, height } => {
                let rectangle = Rectangle { width, height };
                // Do something with the rectangle...
            },
            Shape::Triangle { base, height } => {
                let triangle = Triangle { base, height };
                // Do something with the triangle...
            },
        }
    }
}
```
